Summary / What this shows

- ¹. Popularity patterns were analysed using **number of projects** as a simple measure of interest.
- ². Yarn weight seems to matter, but results are strongly influenced by a few very popular patterns.
- ³. Free and paid patterns behave a bit differently, but the sample is small so this is only exploratory.

Notes & Limitations

- ¹. The dataset was limited to **100 patterns**, mainly to keep the project manageable.
- ². Some values (especially popularity) are skewed by **outliers with very high project counts**.
- ³. This dashboard is meant as a **visual summary**, supporting the Python EDA notebook rather than replacing it.
